AB The material comprises (I) a matrix materials, (II) an effective absorbing amt. of a cyclodetrin materials which is dispersed in the matrix material, and (III) nanosized particles of zinc or similar reacting metal alloy (e.g, nanozinc). The cyclodextrin, free of an inclusion complex compd., comprises an .alpha.-cyclodextrin, a .beta.-cyclodextrin, a .gamma.-cyclodextrin or mixt. thereof, having pendant moieties or substituents that render the cyclodextrin compatible with the matrix materials (e.g., triacetyl .alpha.-cyclodextrin). The material is suitable for food-contact packaging, flexible packaging to dispose of adult and baby diapers, incontinent products, hospital and household waste and also for packaging pharmaceutical products, medical devices and dental materials.

AB The present invention provides a compn. for prepg. substances having nano-pores, said compn. comprising cyclodextrin deriv. as porogens, thermostable org. or inorg. matrix precursor, and solvent for dissolving said two solid components. There is also provided a low-k interlayer insulating film having evenly distributed nano-pores with a diam. less than 50 .ANG., which is required for semiconductor devices. Thus, hydrosilylating 2,4,6,8-tetramethyl-2,4,6,8-tetravinylcyclotetrasiloxane with trichlorosilane, followed by reacting the resulting deriv. with MeOH gave 2,4,6,8-tetramethyl-2,4,6,8-tetra(trimethoxysilylethyl)cyclotetrasiloxane, which was ring-opening polymd. to give a polysiloxane (I). Mixing 12% a purified I with 10.0% heptakis(2,4,6-tri-O-methyl)-.beta.-cyclodextrin in MIBK, spin coating the resulting mixt. on a boron-doped Si

wafer, baking at 150.degree. and at 250.degree. for 1 min each and calcining at 420.degree. for 60 min gave a dielec. film with thickness 5909 .ANG. and dielec. const. 2.25.

AB Tetraphenylporphyrin derivs. of the general formula (I) or salts thereof [R1, R2, R3 and R4 are each independently a group represented by the formula Q, p-(n-dodecyloxy)phenyl, or 2,4,6-trimethylphenyl with the proviso that at least one of R1 to R4 is the group represented by the formula Q and at least one of the others is p-(n-dodecyloxy)phenyl] are prepd. These compds. I are nontoxic to cells in darkness, possess increased hydrophilicity and lipophilicity due to the introduction of maltohexaose and decyl groups, and exhibit the selectivity for binding to tumor cells owing to the cell recognition by maltose residue, and show cytotoxicity under irradn. with long wavelength light which is transmissive in cells or tissues. Thereby, they are useful as photosensitizers for photodynamic therapy (PDT) or photodynamic diagnosis (PDD) or as pressure-sensitive coatings. Thus, a soln. of 1.0 g 4-acetoxybenzaldehyde, 1.6 g 4-decyloxybenzaldehyde, and 0.85 mL pyrrole in 200 mL propanoic acid was refluxed for 1 h to give 3.1% 5,10-di(4-decyloxyphenyl)-15,20-di(4-hydroxyphenyl)porphyrin which (20.7 mg) was stirred with 163.5 mg 1-iodopropyl nonadeca-O-acetyl-.beta.-D-maltohexaose and 1 g K2CO3 in 20 DMF at room temp. for 60 h to give 45% 5,10-di(4-decyloxyphenyl)-15,20-bis[4-[3-(nonadeca-O-acetyl-.beta.-D-maltohexaosyloxy)propoxy]phenyl]porphyrin (II). Deacetylation of II with NaOMe in methanol gave 69.3% 5,10-di(4-decyloxyphenyl)-15,20-bis[4-[3-(.beta.-D-maltohexaosyloxy)propoxy]phenyl]porphyrin (III). When irradiated by a 500 W halogen lamp fitted with a filter (cut-off wavelength of 500 nm and shorter), III in vitro showed cytotoxicity against Hela cells.

AB The present invention is directed to a method of making an inclusion complex comprising an acylated cyclodextrin host mol. and a guest mol., wherein the method comprises the steps of: (a) contacting the acylated cyclodextrin host mol. and the guest mol. to form an inclusion complex; and (b) pptg. the inclusion complex in an aq. medium. The present invention is further directed to an inclusion complex comprising an acylated cyclodextrin host mol. and a guest mol., wherein the guest mol. comprises form about 2 (wt.) to about 15 (wt.) of the inclusion complex. Moreover, the present invention relates to a compn. comprising a polymer and an inclusion complex, wherein the inclusion complex comprises an acylated cyclodextrin host mol. and a guest mol. and medical devices and solid pharmaceutical compns. comprised thereof. Triacetyl .beta.-cyclodextrin-nitroglycerin complexes were prepd. and release of nitroglycerin from the complex studied.

AB A peracetylated hexaamylose (maltohexaose) was obtained by an improved acetolysis of cyclomaltohexaose (.alpha.-cyclodextrin, .alpha.-CD), and transformed into the benzyl- and 4-chlorobenzyl-protected thioglycosides. Sequential chain elongation by glycosidation of the C-ethynylated glucosides gave the .alpha.-anomeric heptaglycosides and their anomers. These were transformed into the glycosyl acceptors. Glycosidation of these acceptors led to the benzyl-protected octasaccharides .alpha..alpha.5.alpha. and .beta..alpha.5.alpha., e.g. I, and to the chlorobenzylated analogs .alpha..alpha.5.alpha. and .beta..alpha.5.alpha. .alpha..alpha.5.beta. and .beta..alpha.5.beta.. Hay coupling of OBn- and OAc-protected linear octaoses .alpha..alpha.5.alpha. and .beta..alpha.5.alpha. led to the cyclooctaamylose (.gamma.-cyclodextrin) analogs. The influence of the constitution and configuration of the linear precursors on the rate and yield of the cyclization was relatively weak. Deprotection and hydrogenation of the cyclooctaamylose (.gamma.-cyclodextrin) analogs yielded the .gamma.-CD analogs, e.g. II, where one glycosidic O-atom is replaced by a butanediyl group, while FeCl3-promoted dechlorobenzylation did not affect the butadiyne moiety and afforded the acetyleno .gamma.-CD analogs. MM3* Force-field calcns. evidence the strong influence of the configuration and constitution of the new .gamma.-CD analogs on the shape of the cavity.

AB The pptn. method was used as a practical and reliable technique for prepg. inclusion complexes of triacetyl-cyclodextrin (CD) that would be applicable to various different types of guest compds. The oily multicomponent vanilla and lemon exts. could be converted to solid triacetyl-CD/fragrance complexes by the pptn. method using acetone as the common solvent. Complexes of triacetyl-CD and fragrances provided an acceptable component distribution and total fragrance load. An aq. alc. soln. was the preferred common solvent in prepg. triacetylated CD/nitroglycerin (NG) and isosorbide 5-mononitrate complexes. X-ray diffractometry and thermoanal. investigations demonstrated complex formation in solid state. Complexation considerably reduced the volatility, thermal and storage stability problems of the complexed guests. Triacetyl-.beta.-CD could be considered as a multiparticulate sustained release carrier matrixes and may be useful for the prepn. of sustained release drug formulations.

AB The invention relates to a method for producing polymers on the basis of 1,3-dienes by radical polymn. of cyclodextrin-complexed 1,3-dienes and optionally other unsatd. monomers which can optionally also be cyclodextrin-complexed, in an aq. soln. optionally in the presence of initiators and, optionally, .gtoreq.1 of chain-transfer agents, additives, and fillers. The water-sol. is increased and the vapor pressure decreased of the dienes by complexing with cyclodextrin, so that emulsifiers are not necessary in the polymn. and the polymn. may be performed in the absence of pressure in water.

AB The process involves at least the steps: (1) formation of an inclusion compd. between a monomer and a cyclodextrin; and (2) polymn. of the monomer within the inclusion compd. by means of a chem. oxidizing agent. The cyclodextrin compd. intermediates are esp. suitable for the manuf. of multilayer printed circuit boards with through connections. Thus, 64 g 3,4-(ethylenedioxy)thiophene was added to a soln. of 600 g 2,6-dimethyl-.beta.-cyclodextrin in 1 L H2O and activated ultrasonically to form an inclusion compd., which was oxidatively polymd. with FeCl3. In the absence of FeCl3 or a similar oxidizing agent the cyclodextrin compd. was stable toward oxidn. by air, and the intensity of the monomer odor was also reduced.

AB A thiol-terminated hexasaccharide, protected with acetyloxy groups (AHS) was synthesized for the purpose of depositing self-assembled monolayers (SAMs) from soln. onto gold surfaces. XPS, ellipsometry, contact angle measurements, and imaging time-of-flight secondary ion mass spectroscopy (iToF-SIMS) were used to det. coverage, homogeneity, chem. compn., film thicknesses, and kinetics of film growth. Deprotection of the mols., i.e. replacing acetyloxy groups by hydroxyl groups, was performed following adsorption of AHS onto the surface, as well as prior to adsorption from soln. The chem. compn. of the resulting films, the film thickness, the d. of mols., and the nature of the surface functional groups were detd.

Adsorption of the deprotected mols. (DHS) from soln. was found to lead to a higher d. of adsorbed species.

AB Title aminodeoxycyclodextrin I was prepd. from .alpha.-cyclodextrin via acetolysis of fully acetylated .alpha.-cyclodextrin resulted in restricted fission of only one of the glucosidic bonds to give the acyclic maltohexaose peracetate and coupling of D-glucosamine precursor with O-benzylated maltohexaoside. Regioselective modifications of both terminals of hexasaccharide were performed by employing Lewis acid-catalyzed thioglycosidation and O-benzylidenation followed by its reductive cleavage as the key reactions, to give the partially O-benzylated maltohexaoside with the sole hydroxy group at the 4VI-position.

AB Claimed was derivs. such as cyclodextrins, e.g. of .beta.-form ring size and bearing non-glycosyl OH groups partially derivatized with O-PhCH2, O-Ac, and deoxy-C-amino or azido groups. Prepn. strategy comprises steps of (1) ring opening of a peracetylated cycldextrins of desired size, (2) thioglycosylating the product peracetylated maltooligomer, (3) deacetylating the thiomaltooligomer, (4) benzylidene-formation of the deprotected oligomer with .alpha.,.alpha.-dimethoxytoluene, and benzylation in the presence of catalyst, (5) deprotection of nonreducing end with BH3.NMe3-AlCl3, (6) coupling the produced oligosaccharide receptor with a desired saccharide donor in presence of catalyst, (7) deprotection as needed, and (8) ring closing using glycosylation catalyst to give final product. Exemplified was the insertion of an .alpha.-cyclodextrin with 6-O-acetyl-2-azido-3-O-benzyl-2-deoxy-4-O-(p-methoxybenzyl)-D-glucopyranose as the heterosaccharide donor.

AB Methoprene [40596-69-8] was included with .alpha.- and .beta.-cyclodextrin (CD) or .alpha.- and .beta.-cyclodextrin peracetate (CDA), and expts. were undertaken to investigate the effects of these inclusion complexes on the feeding period of 5th instar of the silkworm (Bombyx mori), cocoon wt., and cocoon shell wt. When the complexes and free methoprene were dissolved into DMSO-MeOH (3:7), and then given topically to the larvae at the 48th h of the 5th instar, the feeding period after the application was clearly prolonged in methoprene .beta.-CD inclusion compd. [94123-02-1] and methoprene .beta.-CDA inclusion compd. [106200-27-5], but nearly equiv. in methoprene .alpha.-CD inclusion compd. [106200-28-6] and methoprene .alpha.-CDA inclusion compd. [**106249-27-8**] in comparison with free methoprene. The cocoon wt. was apparently increased with the prolongation of feeding period, but the cocoon shell wt. was not always increased and the percentage of cocoon shell wt. was decreased with the high activity of methoprene. The disappearance rate of methoprene in .beta.-CD and .beta.-CDA complexes on the cuticle of larvae was smaller than that of free methoprene. Therefore, the prolongation of feeding period in 5th instar and the increase of cocoon wt. by the inclusion complexes would be caused by the slow release of methoprene from the complex.

LANGUAGE: English
AB Peracetylation of Me .alpha.- or .beta.-D-glucopyranoside reversed the order of the chem. shifts of the 6,6'-methylene protons; thus, the normal H-6R signal downfield of H-6S appears upfield in the spectra of the tetraacetates. Data for a wide range of regioselectively acetylated D-glucose derivs. shows that the reversal in chem. shifts of the methylene protons occurs only when both O-4 and O-6 are acetylated. Hence in the disaccharide series, shift reversal is not obsd. with glucose residues that are bonded glycosidically through O-4, whereas the reversal occurs when the linkage is through O-3. A conformational model to account for these effects suggests that the 4- and 6-O-acetyl substituents are oriented by a weak, mutual, interaction so that the magnetic anisotropy of the CO group of the 6-O-Ac can induce selective deshielding of H-6S. The comparable influences of O-benzoyl and O-(4-nitro)benzoyl substituents on

chem. shift are consistent with this proposal. D-Mannopyranosides have characteristics analogous to those of their D-gluco epimers, whereas D-galactopyranosides give a different, more complex, chem. shift pattern.

AB Methods for the complete or partial (selective) silylation of .beta.-cyclodextrin are described that provide intermediates for further derivatization. The method is applied to the sequential attachment and attempted capping of .beta.-cyclodextrin by a porphyrin template. Representative proton NMR spectra for a series of silyl derivs. and intermediates are analyzed to demonstrate further the advantage of the method.

AB The primary hydroxy groups of .alpha.-cyclodextrin were modified via benzoylation of all 18 hydroxy groups and selective debenzoylation of the primary hydroxy groups, or by selective activation of the primary hydroxy groups via a triphenylphosphonium salt and substitution with azide. The products obtained included hexakis(6-amino-6-deoxy)-.alpha.-cyclodextrin.6HCl and hexakis(6-O-methyl)-.alpha.-cyclodextrin. .beta.-Cyclodextrin gave heptakis(6-azido-6-deoxy)-.beta.-cyclodextrin tetradeca(2,3)acetate by direct substitution.

AB In examg. orientations of glycosidic linkages, measurements of three-bond coupling between 13C-1 and 1H-4', or 13C-4' and 1H-1, have been made from natural abundance, 1H-coupled, 13C-NMR spectra of maltose, cyclohexaamylose, and related compds. Maltose and cyclohexaamylose in water exhibit inter-residue 13C-O-C-1H couplings of close to 3 Hz. In terms of torsional angles, .PHI. and .PSI., these findings suggest that, in aq. soln., the mols. favor conformations that are appreciably more staggered than those known to exist in the solid state. Analogous measurements on O-acetyl derivs. suggest that .PHI. is smaller, and .PSI.larger, than in maltose. Data are also presented for sucrose, maltosan, and .alpha.,.alpha.-trehalose.

AB The conformation of the monomeric units and of the polymeric chain of the peracetates of .alpha.- and .beta.-cyclodextrin and amylose were investigated by ir and PMR spectroscopy. The spin-spin coupling consts. of the ring protons and the ir spectra indicate the C1 conformation for the D-glucopyranose units. The ir dichroism of an oriented film of amylose triacetate is consistent with a helical conformation of the chain. The chem. shift difference of signals for H-1 and H-4 in .beta.-cyclodextrin triacetate (assumed to be in a "quasieclipsed" chain conformation) and amylose triacetate is consistent with a rotation of the monomeric units of amylose triacetate around the C-1-O and C-4-O bonds. The solvent effect on the chem. shift of the ring and acetyl protons was studied and assignments for the acetyl signals of the triacetates of cyclodextrins and amylose are proposed.

AB The .alpha.- and .gamma.-CD analogs, which possess a hexa-2,5-diyne-1,6-dioxy unit, were synthesized by intramol. coupling of the bis-O-propargylated maltohexaoside, or the analogous maltooctaoside, followed by deprotection. The dialkynylated linear oligosaccharides were obtained by glycosidation of propargyl alc. with protected hexa- or octa-.beta.-D-phenylthio-maltosides, reductive cleavage of the benzylidene acetal, and propargylation of the terminal HO-C(4) group, resp. Two .beta.-CD analogs, which possess a penta-1,3-diyn-1-yl-5-oxy unit, were similarly obtained by intramol. oxidative coupling. The linear dialkynylated oligosaccharides used were obtained by two consecutive glycosylations, first with protected phenylthio-.beta.-D-malto-hexosides as donor, and then by glycosylation of the resulting propargyl maltohexoside with the C(4)-ethynylated donor I (R = p-chlorobenzyl). The proximity of the terminal units of maltooligosaccharides allowed a facile intramol. cycloaddn. of a protected .alpha.-2-azidoethynyl-4''''''-O-propargyl-hexamaltoside to the isomeric triazoles, which were deprotected. Anal. of the intramol. H-bonds in five products showed that insertion of a noncarbohydrate link interrupts a single flip-flop H-bond.

AB Purpose. Because of its ability to form complexes with drugs, .gamma.-cyclodextrin is of great potential value in pharmaceutical formulations. The biol. fate of .gamma.-cyclodextrin must therefore be considered in safety evaluation, using sensitive and specific methods applicable to biol. fluids. Methods. Antibodies were raised against .gamma.-cyclodextrin, allowing the development of a new enzyme immunoassay. The anal. characteristics of this assay were evaluated. Rats were given a single i.v. 25 mg/kg dose of .gamma.-cyclodextrin. Plasma and urine samples were collected and assayed. Results. This new enzyme immunoassay was sensitive (limit of detection close to 94 pg/mL) and suitable for quantification of .gamma.-cyclodextrin in urine and plasma after methanol extn. The use of different linear and cyclic compds. demonstrated the high specificity of the assay. After i.v. administration, the concn. of .gamma.-cyclodextrin rapidly decreased in the plasma while the mol. was probably distributed into the tissues. Although urinary elimination predominates, only 50% of the injected .gamma.-cyclodextrin was recovered in urine, suggesting enzymic degrdn. and/or tissue storage. Conclusions. This assay may provide important information on the fate of .gamma.-cyclodextrin inclusion complexes dedicated to drug-delivery using various modes of administration (oral, parenteral, transmucosal or dermal).

AB An amylose-like .alpha.-(1,4)-glucan was synthesized by polycondensation and subsequent deprotection of a partially benzylated Ph 1-thio-.beta.-maltooctaoside having a sole hydroxyl group at the non-reducing end. The key octasaccharide monomer 6 was prepd. by means of a single-site acetolytic reaction of fully acetylated .gamma.-cyclodextrin and several subsequent chem. manipulations at its reducing and non-reducing ends. On activation with Me triflate, the polycondensation of 6 was found to proceed in di-Et ether through intermol. glycosidation. The mol. wt. of the product obtained by preparative GPC on Sephadex LH-60 was 10 000-18 000. Removal of the O-benzyl groups under Birch reaction gave .alpha.-(1,4)-glucan, the stereoregularity of which was confirmed by 1H and 13C NMR spectroscopy.

AB Heptakis(2,3,6-tri-O-acetyl)-.beta.-cyclodextrin (TA-.beta.-CyD) and octakis(2,3,6-tri-O-acetyl)-.gamma.-cyclodextrin (TA-.gamma.-CyD) were prepd. for use as hydrophobic carriers of buserelin acetate (BLA), an agonist of LH-releasing hormone. The results from this study suggest that the in vitro release of BLA from the peanut oil suspension into the aq. phase was retarded by complexation with TA-CyDs. A single s.c. injection of the oily suspension of BLA contg. TA-.beta.-CyD and TA-.gamma.-CyD in rats led to retardation of plasma levels of BLA, resulting in 25- and 39-fold longer mean residence times, resp., than that of BLA alone. Simultaneously with the suppression of plasma testosterone to castrate level, the pharmacol. effectiveness of BLA continued for 1-2 wk and significant wt. redn. of genital organs was obsd. due to the antigonadal effect. Since TA-.beta.-CyD and TA-.gamma.-CyD were degraded enzymically in rat skin homogenates, both TA-CyDs can be useful as bioabsorbable sustained-release carriers for hydrophilic peptides following the s.c. injection of an oily suspension.

EP 1994-301884 19940316

AB Enantiomers of 4-(3,4-dichlorophenyl)-3,4-dihydro-1(2H)-naphthalenone (I) are resolved on an industrial scale by contacting racemic I with a homogeneous or nonhomogeneous liq. mixt. of a solvent (e.g., alcs. alkanes, ketones, etc.) and water, pure and unsupported .gamma.-cyclodextrin or its derivs. are added to form a selectively bound I enantiomer complex, the mixt. stirred or centrifuged to sep. the complex ppt., and the I enantiomer sepd. from the cyclodextrin complex by solvent extn.

AB An equation relating 3-bond 13C-proton coupling and torsional bond angle was applied to detg. the interglycosidic torsional angle in acetylated cyclomaltodextrins, cellulose triacetate, and amylose triacetate.

AB The vicinal or 3-bond coupling consts. [3J(C,H)] values were measured by using 2-dimensional J heteronuclear-resolved NMR spectroscopy to est. interglycosidic conformations in various oligosaccharides with a d.p. ranging from 6 to 30.

AB Carbon-13 chem. shifts were detd. for cyclohexa-, -hepta-, and -octamylose, amylase, Me 6-deoxy-.alpha.-D-glucopyranoside, 6-deoxycyclohexaamylose and its peracetate, and the peracetates of cyclohexa-, -hepta-, and -octaamylose. Steric effects imposed by the cyclic nature of the dextrins on the conformation of the glycopyranose residues were reflected in their spectra.
